Project: analyzing basketball data

Notes:

Rebecca: Predict team performance from players

Both: getting data from different seasons and getting a schedule

Rebecca: classification by head injury

Jay: building models from the ground up or using libraries

Rebecca: training and test data, then using all of the data

Classification, supervised learning vs .unsupervised learning

Rebecca: look at the "Puppies, Sharks, and Bears" project to find more analysis methods.

Addressing these feedback:

We were already thinking about some of these, but there were some new ways to analyze the data that were presented, which were helpful to think about. We plan to implement as many of the analysis methods that we have come up with as possible.
